Introduction

Before installing Mixpost Enterprise, make sure you have a valid license.

There are three ways to install Mixpost Enterprise:

1. If you already have a Laravel 10 application, you can install Mixpost Enterprise as a package inside it. By doing so, you can integrate Mixpost into your application in many interesting ways. If you know Laravel, then this is the recommended route. Head over to the package installation instructions to continue.
2. If you have experience with Laravel and PHP, but don't want to install Mixpost in an existing Laravel application, you can use our standalone app. This standalone app is a regular Laravel app, which Mixpost Enterprise has been preinstalled with. You can use Composer to create this standalone app.
3. If you have experience with Docker, you can use our docker image.
